SESSION: 04

REPORT ON: AADK REPORT

TITLE:

COMPOSE BASICS AND UI LAYOUTS

1. Introduction

Session 4 focused on applying fundamental Jetpack Compose concepts through practical UI layout planning and structured reflection. The primary goal was to understand how composables such as Column, Row, Box, Image, Text, and Modifier work together to create structured and visually balanced user interfaces.

Instead of immediately writing code, this session emphasized planning, layout hierarchy understanding, spacing consistency, alignment techniques, and accessibility considerations. This approach improves UI clarity and ensures efficient implementation when coding begins.

By the end of this session, I developed the ability to design balanced layouts that are responsive, readable, and accessibility-compliant.

---

2. Understanding Compose Layout Fundamentals

Jetpack Compose uses composables as building blocks of UI. These composables are arranged hierarchically to build screens.

Key Layout Composables Practiced:

1. **Column**

- Arranges elements vertically.
- Useful for stacking UI elements from top to bottom.
- Often used as a primary screen container.

2. **Row**

- Arranges elements horizontally.
- Useful for icon-text combinations or side-by-side elements.

3. **Box**

- Allows stacking elements on top of each other.

- Useful for overlays or alignment control.

4. **Modifier**

- Controls layout behavior (padding, size, alignment, background, etc.).
- Order of modifiers affects layout outcome.

Through experimentation, I learned that proper nesting of these composables determines the entire layout structure.

3. Business Card Layout Planning

For this task, I designed a "Developer Portfolio Card" layout before implementation.

Layout Objective:

Create a clean, centered, professional UI displaying:

- Profile Image
- Name
- Role
- Short Bio
- Contact Details

Layout Structure (Phone – Portrait Mode)

Structure:

```
Column (Main Container)
    Image
    Spacer
    Text (Name)
    Text (Role)
```

Spacer
Row (Icon + Email)
Row (Icon + LinkedIn)

Design Decisions:

- Used Column as main container for vertical stacking.
- Applied 16dp outer padding for breathing space.
- Used Spacer composables for consistent spacing.
- Used Row for horizontal alignment of icon and contact text.
- Centered content using horizontalAlignment.

This ensured visual balance and readability.

4. Alignment and Spacing Improvements

During layout planning and review, I evaluated alignment and spacing consistency.

Observations:

- Vertical stacking improves readability.
- Consistent spacing (8dp, 12dp, 16dp) creates visual harmony.
- Too little spacing makes UI look crowded.
- Too much spacing wastes screen real estate.

Improvements Applied:

- Increased spacing between title and subtitle.
- Ensured equal margin around card edges.
- Adjusted icon-to-text spacing for clarity.

This step helped me understand that spacing is as important as content itself.

5. Responsiveness & Screen Adaptation

A major focus of this session was ensuring UI responsiveness.

Phone (Portrait):

- Column layout works best.
- Center-aligned content improves aesthetics.

Landscape / Tablet:

- Switched to Row layout.
- Image placed left.
- Text content placed right.
- Increased padding to 24dp.

This adaptive approach prevents excessive vertical stretching and makes better use of horizontal space.

Understanding responsive planning before coding reduces future redesign effort.

6. Readability & Accessibility Considerations

Accessibility is a critical part of modern UI development.

Improvements Implemented:

- Added contentDescription for profile image.
- Maintained minimum touch target size (48dp).
- Ensured readable font sizes:
    - Title: 28sp
    - Subtitle: 18–20sp

    - Contact text: 14–16sp
- Used high contrast between text and background.

Why This Matters:

Accessibility compliance ensures:

- Usability for visually impaired users
- Better professional standards
- Improved user experience

Compose makes accessibility easier when planned properly.

7. Reflection on Compose Learning

This session strengthened my understanding of layout hierarchy and composable structure. Instead of trial-and-error coding, I learned to:

- Think in UI blocks.
- Design layout structure before implementation.
- Maintain spacing consistency.
- Plan for responsiveness early.
- Evaluate readability and accessibility.

I realized that well-planned layouts reduce debugging time and improve code clarity. Compose encourages declarative thinking, where UI reflects state rather than manual updates.

8. Key Learning Outcomes

By completing this session, I achieved:

✓ Clear understanding of Column, Row, and Box usage
✓ Ability to plan layout hierarchy before coding
✓ Awareness of spacing and alignment consistency
✓ Understanding of responsive layout adaptation
✓ Knowledge of accessibility requirements
✓ Improved UI review and refinement mindset

This session significantly improved my confidence in designing Compose layouts efficiently.

9. Conclusion

Session 4 – AADK Task 4 provided practical exposure to Compose basics and UI layout design. By focusing on planning, reviewing, and improving layouts before coding, I developed a structured approach to UI development.

The skills learned in this session will directly support future Android development tasks, ensuring that my Compose UIs are balanced, readable, responsive, and accessible.

This structured methodology prepares me to build scalable, maintainable, and professional user interfaces in real-world applications.
